

## Press Release

---

*For Immediate Release*

### *Terion and DriverTech™ Share Technologies to Link Trucks and Trailers*

Plato, Texas, April 18, 2006 - Terion, Inc. and DriverTech, Inc. today announced that they will integrate Terion's FleetView 3® trailer tracking system and DriverTech's DT4000 system. The two products will seamlessly share data between the in-cab and trailer systems while the trailer is connected to the tractor— information that has traditionally been gathered and analyzed separately. By delivering both types of data in one format, Terion and DriverTech will provide least cost routing capabilities and create synergies in event detection and reporting.

"With over 100,000 units installed, Terion has established itself as the leader in trailer management technology, and we see the integration of trailer information and in-cab data the logical next advancement. This collaboration gives the transportation industry the most comprehensive solution available," said Terion president and CEO Ken Cranston. "We're excited about working with DriverTech to combine our industry leading solutions."

"DriverTech's TruckPC™ Fleet Management system takes advantage of low-cost IP networks like cellular and WiFi, and leverages powerful software solutions to deliver significant operational benefits such as improved customer service," said Mark Haslam, DriverTech's president and CEO. "By combining our progressive in-cab system with Terion's world class trailer management system, we can dramatically increase productivity for our customers."
